You are presenting

**CLAMPERS**

- A circuit that places either the Positive [or] Negative peak of a signal at a desired DC level is known as a Clamper.

- Clamper essentially adds a D.C. component to the signal.
- Input signal is a sine wave having a peak-to-peak value of 10V.
- Clamper adds the D.C. component and pushes the signal upwards, So that the negative peaks fall on the zero level.
- Output waveform has peak values of +10V and 0V.

**DETECTORS**

- One of the most important application of a semiconductor diode was as a detector for Amplitude Modulated (AM) radio signals.
- An Amplitude Modulated signal consists of a Radio-frequency carrier wave whose amplitude varies with an audio frequency.

SUBJECT :AUTOMOBILE ENGINEERING

FACULTY NAME :V.PAVAN KUMAR

TOPIC : Main Components of an Automobile

YEAR : IV

## Components of a four wheeler Automobile

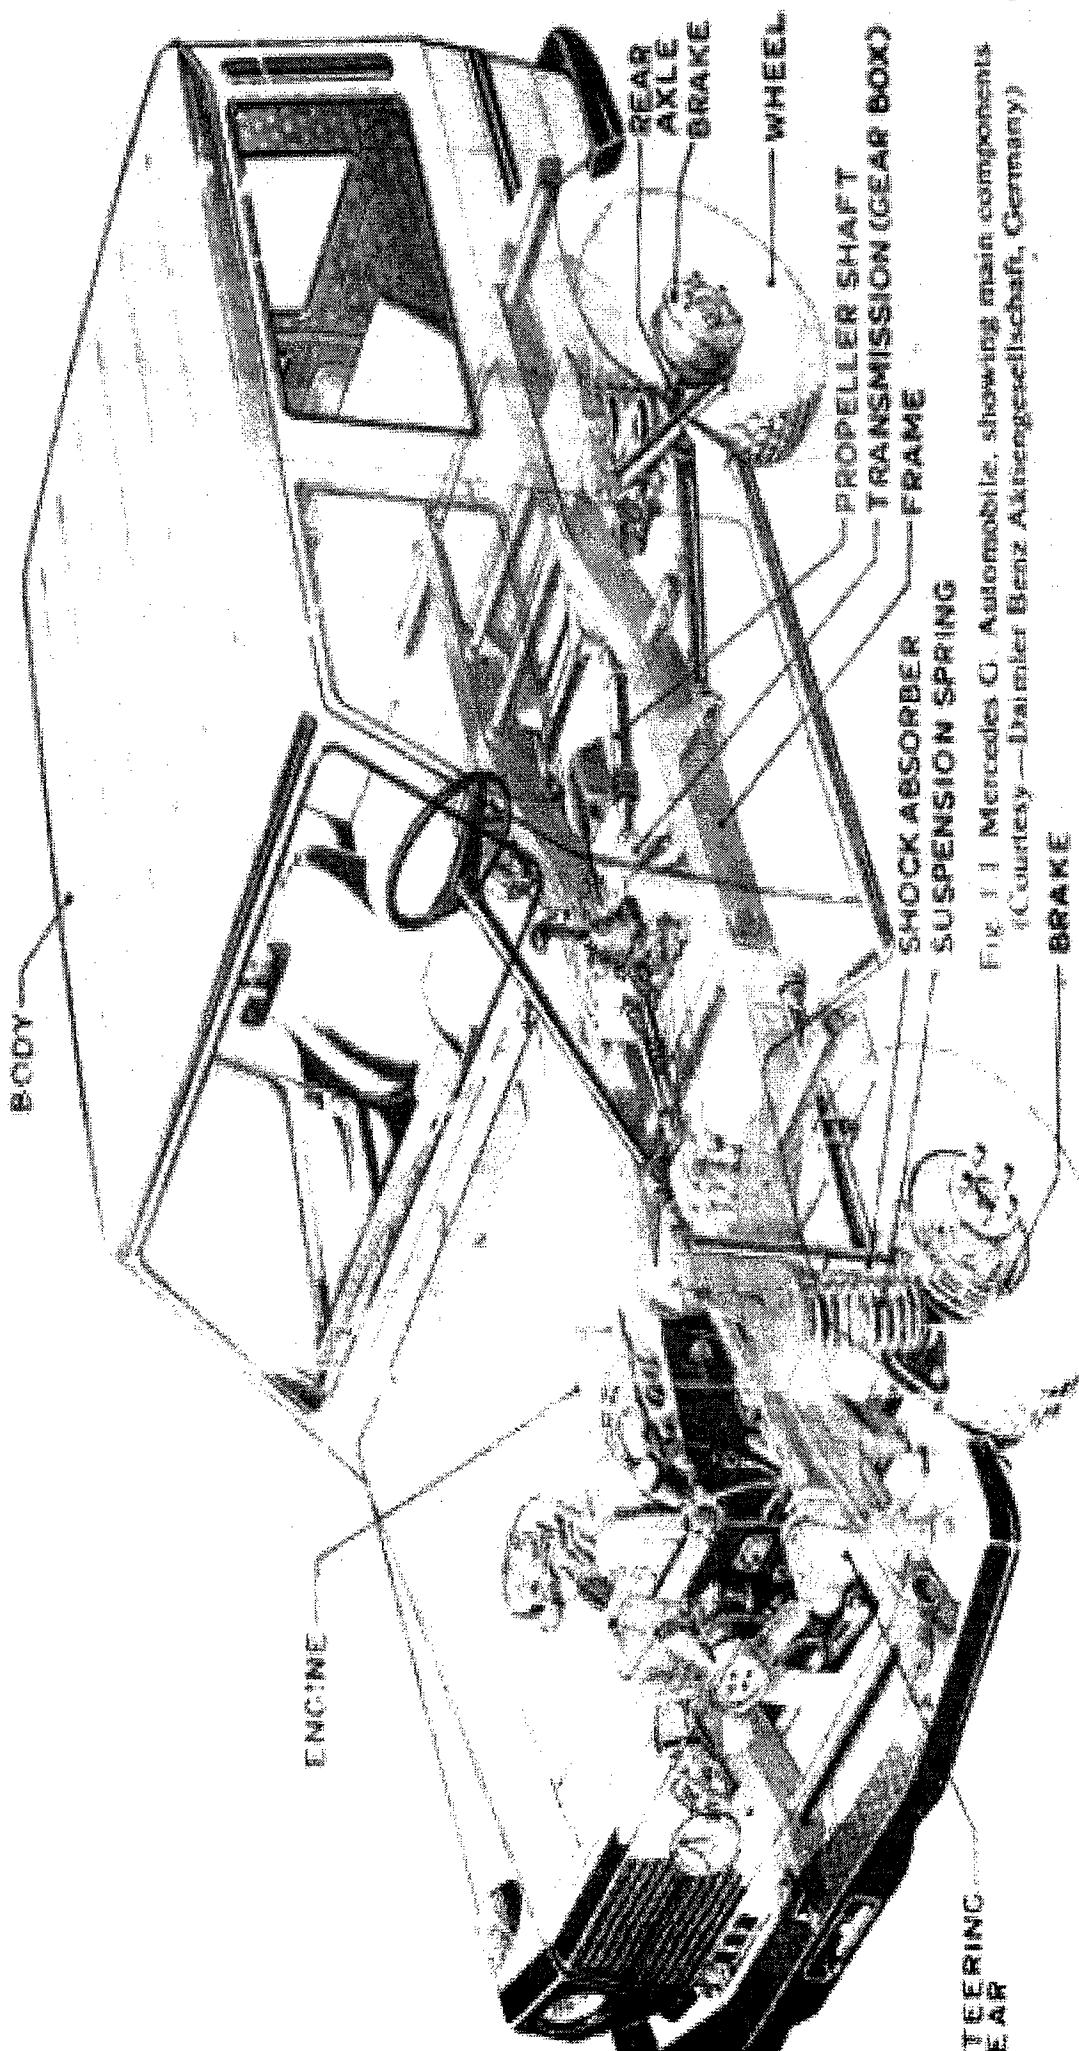

About 1500 separate parts are put together make an automobile.

These parts are grouped into several system. Each system is made up of two or more part that work together to perform a specific job. The automotive vehicles are produced in large variety of sizes and shapes.

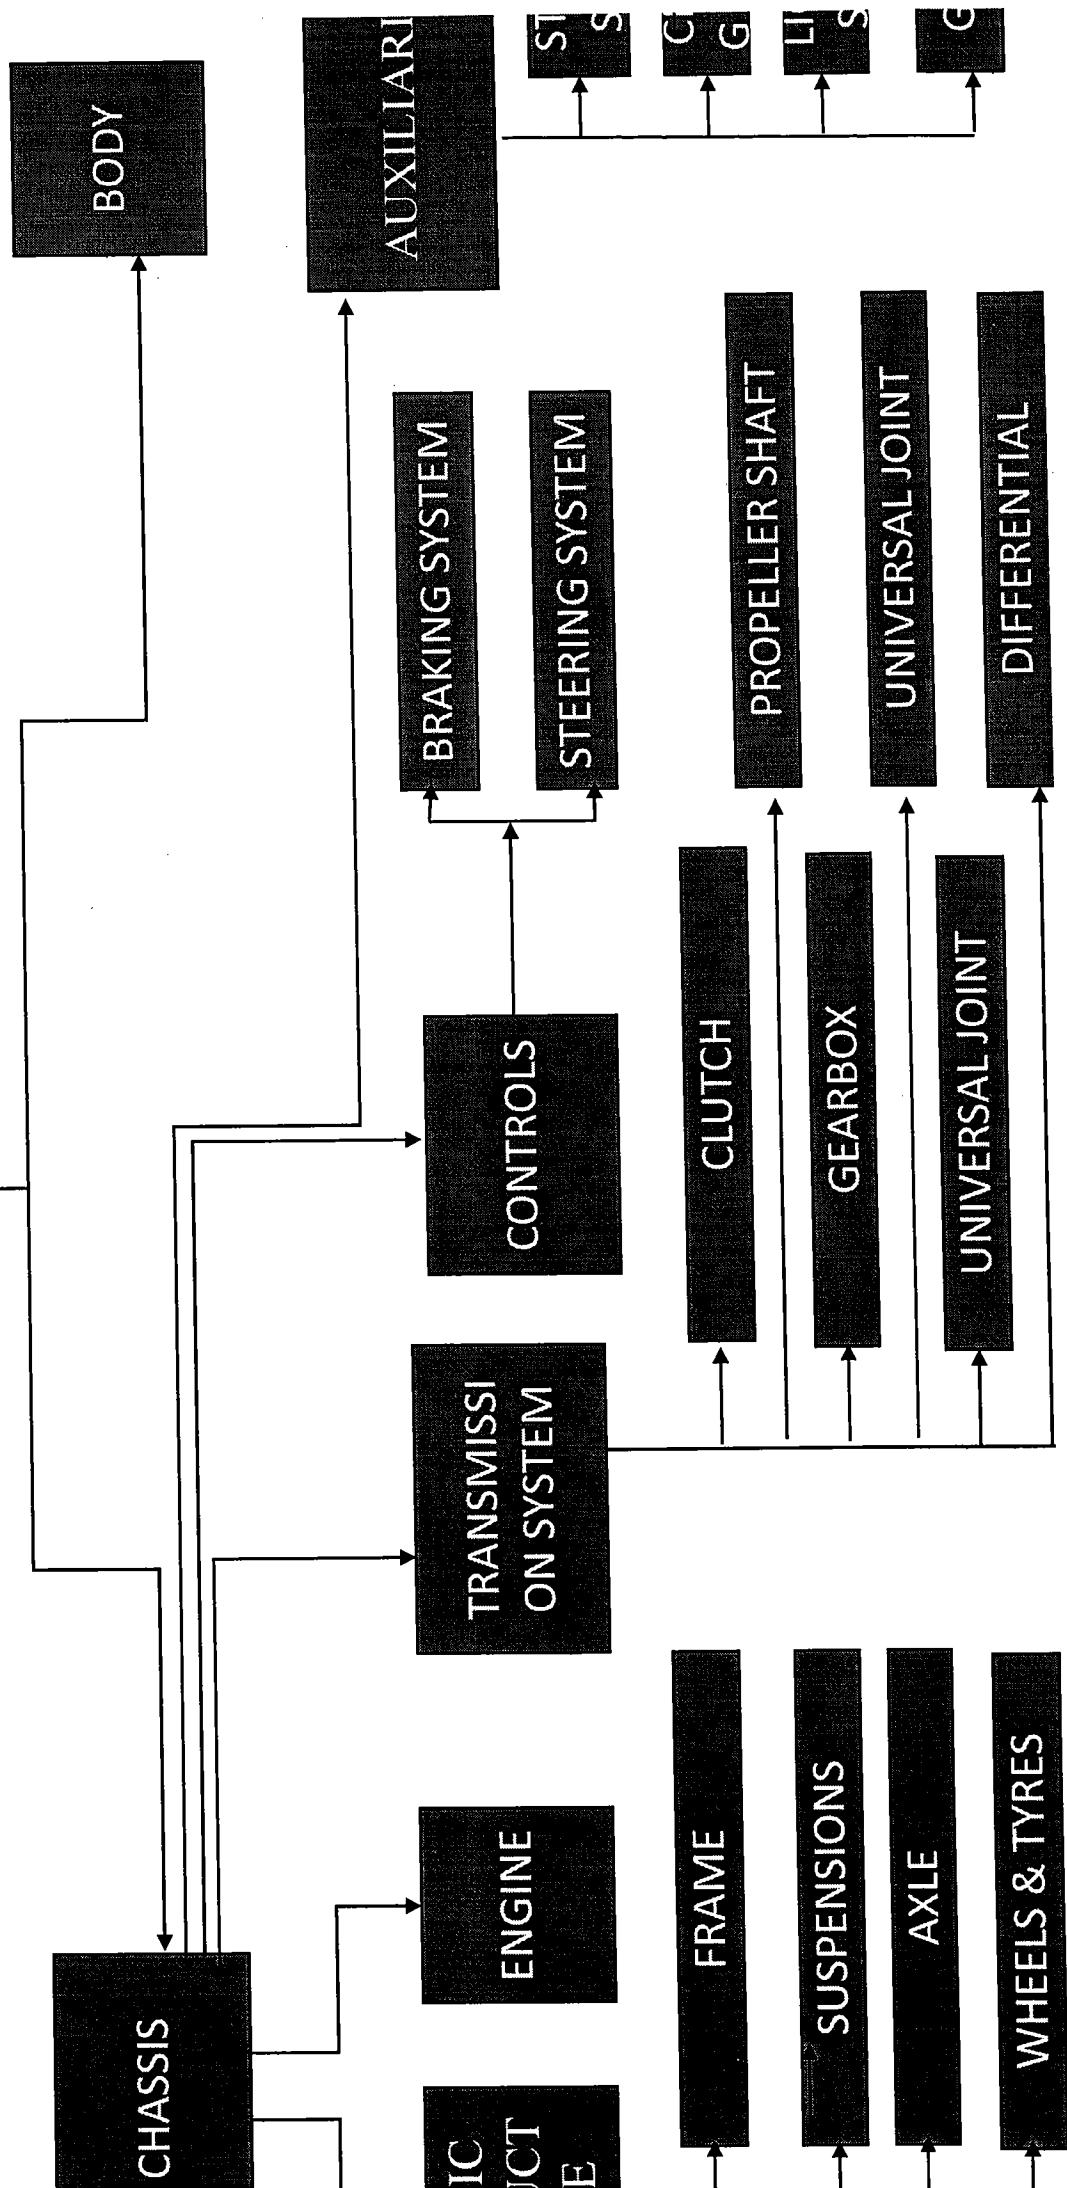

All have the same basic parts and systems.

# COMPONENTS OF AUTOMOBIL

AUTOMOBILE ENGINEERING

# COMPONENTS OF AN AUTOMOBILE

# Main Components of an Automobile

**Basic Structure** - It consists of the frame, the suspension system, axles. wheels and i.

**Engine** - It provides the motive power for all the various functions which the vehicle part or it, may be required to perform. The Engine for automotive use is of internal combustion type.

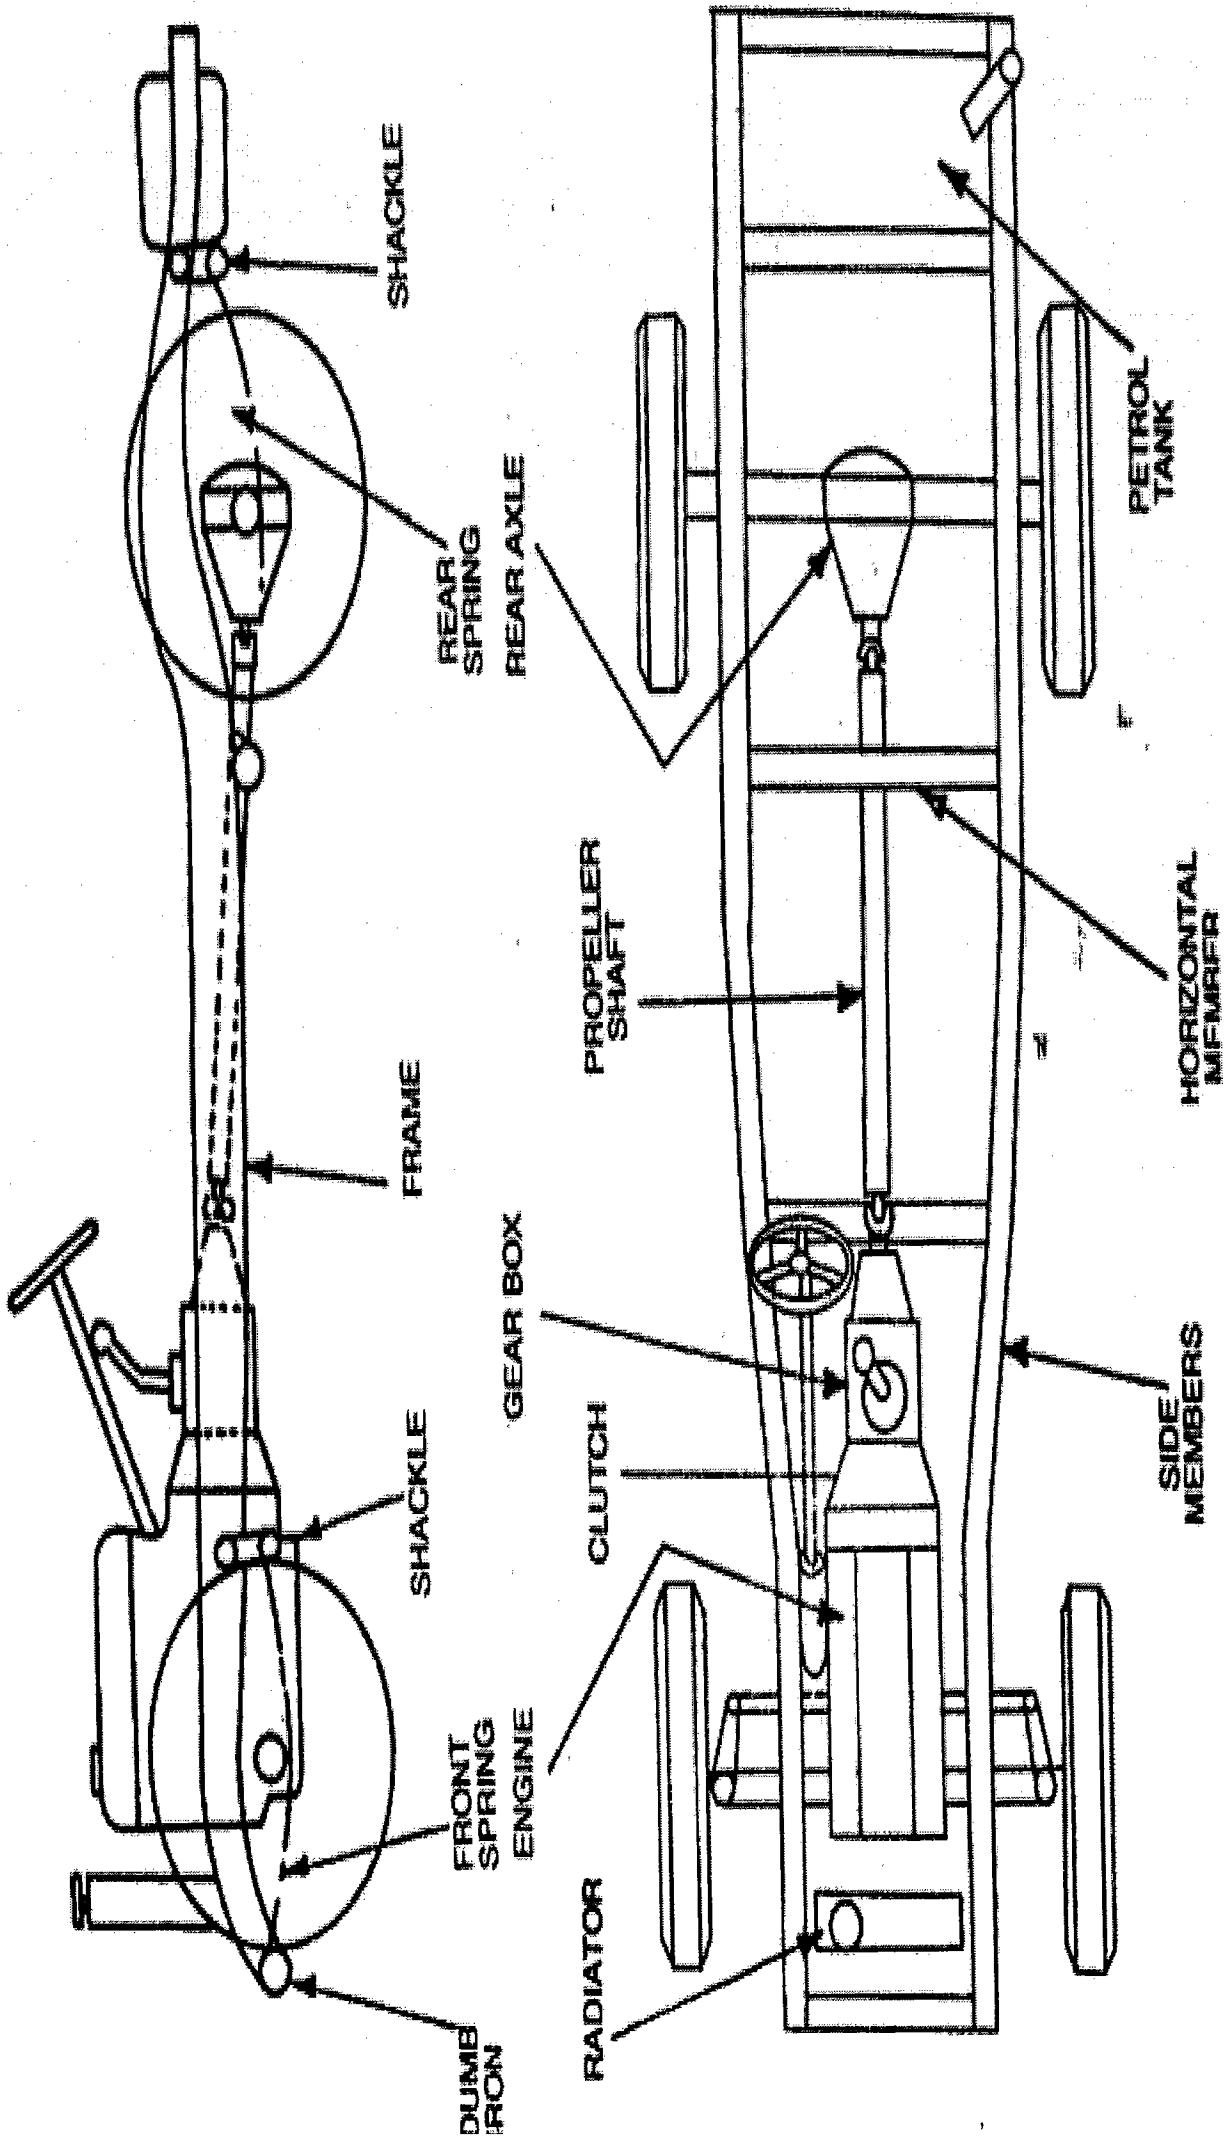

**Transmission System** - It consists of a Clutch, a gear box giving four, five or even 11 different ratios of torque output to torque input, a propeller shaft to transmit the torque of the gearbox to the rear axle and a differential gear to distribute the final torque between the driving wheels.

**Auxiliaries** - The Principle one out of these is the electrical system.

**Controls** - They consist of steering system and the brakes.

**Superstructure** - In those cases where frameless construction is not adopted there n superstructure, i.e., The Body.

# CHASSIS

# INTRODUCTION OF CHASSIS FRAME:

Chassis is a French term and was initially used to denote the frame parts or Body structure of the vehicle.

the back bone of the vehicle.

Vehicle with out body is called Chassis.

Components of the vehicle like Power plant, Transmission System, Axle Shafts and Tyres, Suspension, Controlling Systems like Braking, Steering etc also electrical system parts are mounted on the Chassis frame.

the main mounting for all the components including the body. So it is also known as Carrying Unit.

## UNIT 5

# Analyzing / Evaluate Architectures

- why,
- when,
- cost,
- benefits,
- techniques,
- planned or unplanned,
- preconditions, and
- results.

  
Head of Department  
COMPUTER SCIENCE ENGINEERING  
PBI Viswadhar Institute of Technology & Science  
KAVALI - 524 201, SPSR, Nellore Dt.

## Why

- Why evaluate an architecture?
- An effective technique to assess a candidate architecture—before it becomes the project's accepted blueprint—is of great economic value.
- With the advent of repeatable, structured methods (such as the ATAM,) architecture evaluation has come to provide relatively a low-cost risk mitigation capability.
- Making sure the architecture is the right one simply makes good sense.
- An architecture evaluation should be a standard part of every architecture-based development methodology.

  
Dr. Dinesh  
Reader, Department  
COMPUTER SCIENCE ENGINEERING  
PG Viswadevi Institute of Technology & Science  
KAVALLI - 524 201, SPSR, Nellore Dt.

## When

- architecture evaluation can be carried out at many points during a system's life cycle.

## Cost

- The cost of an evaluation is the staff time required of the participants.

## Benefits

- six benefits that flow from holding architectural inspections.
  1. Financial.
  2. Forced preparation for the review
  3. Captured rationale
  4. Early detection of problems with the existing architecture
  5. Validation of requirements
  6. Improved architectures

## DISTRIBUTED COMPUTING

### Introduction:-

**Distributed computing** is a field of Computer Science that studies distributed systems.

**A distributed system** is a system in which it's hardware or software components are located at networked computers, communicate and coordinate their actions by message passing techniques in order to achieve a common goal.

Distributed system **consists of many machines working together** to provide some services or to implement some Applications which appears to its users as a “single coherent system”.
